

ASYNC JS, PROMISES, & REQUESTS

THE CALL STACK

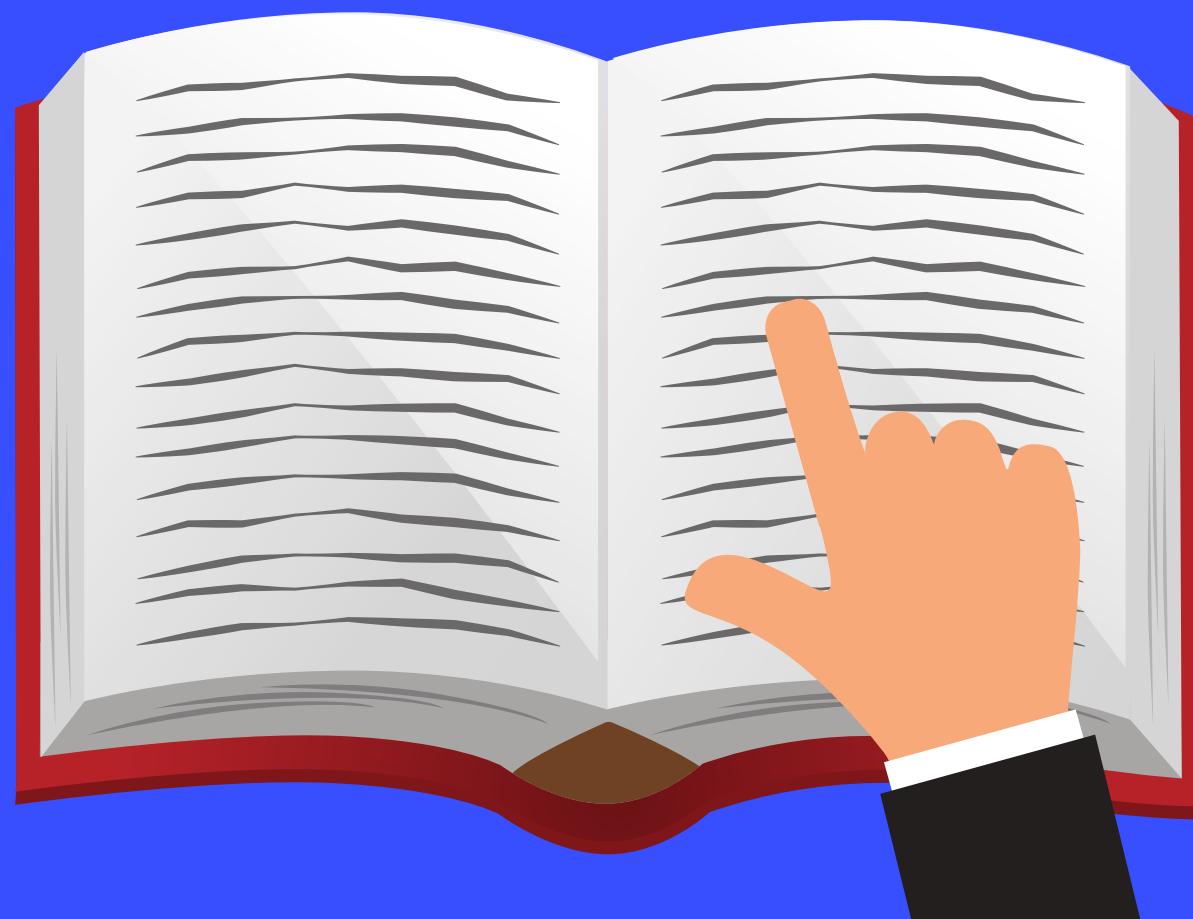

CALL STACK

The mechanism the JS interpreter uses to keep track of its place in a script that calls multiple functions.

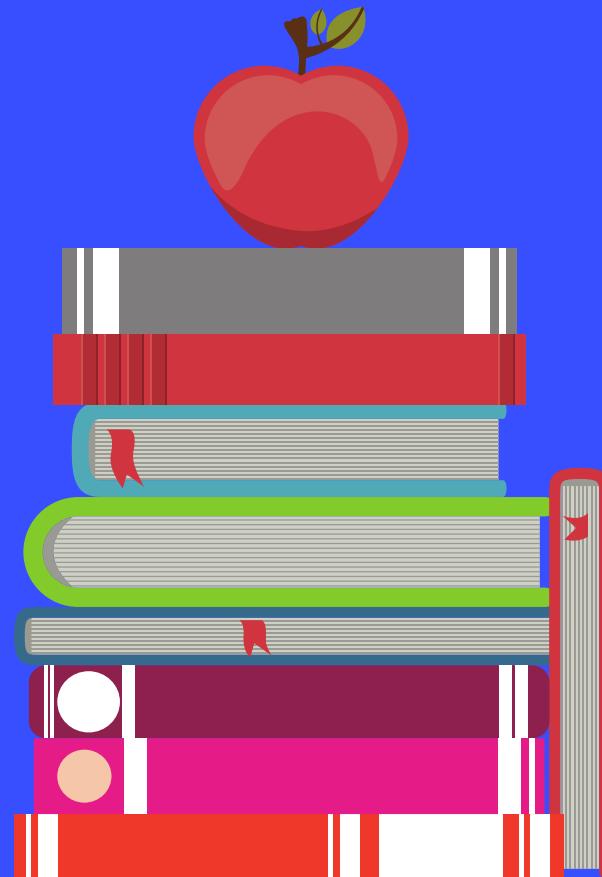

How JS "knows" what function is currently being run and what functions are called from within that function, etc.

CALL STACK

Let's see...
where was I? !

LAST
THING
IN...

FIRST
THING
OUT...

HOW IT WORKS

- When a script calls a function, the interpreter adds it to the call stack and then starts carrying out the function.
- Any functions that are called by that function are added to the call stack further up, and run where their calls are reached.
- When the current function is finished, the interpreter takes it off the stack and resumes execution where it left off in the last code listing.

```
const multiply = (x, y) => x * y;  
  
const square = (x) => multiply(x, x);  
  
→ const isRightTriangle = (a, b, c) => {  
    return square(a) + square(b) === square(c);  
};  
  
isRightTriangle(3, 4, 5);
```

isRightTriangle(3,4,5)
square(3)+square(4)
==== square(5)

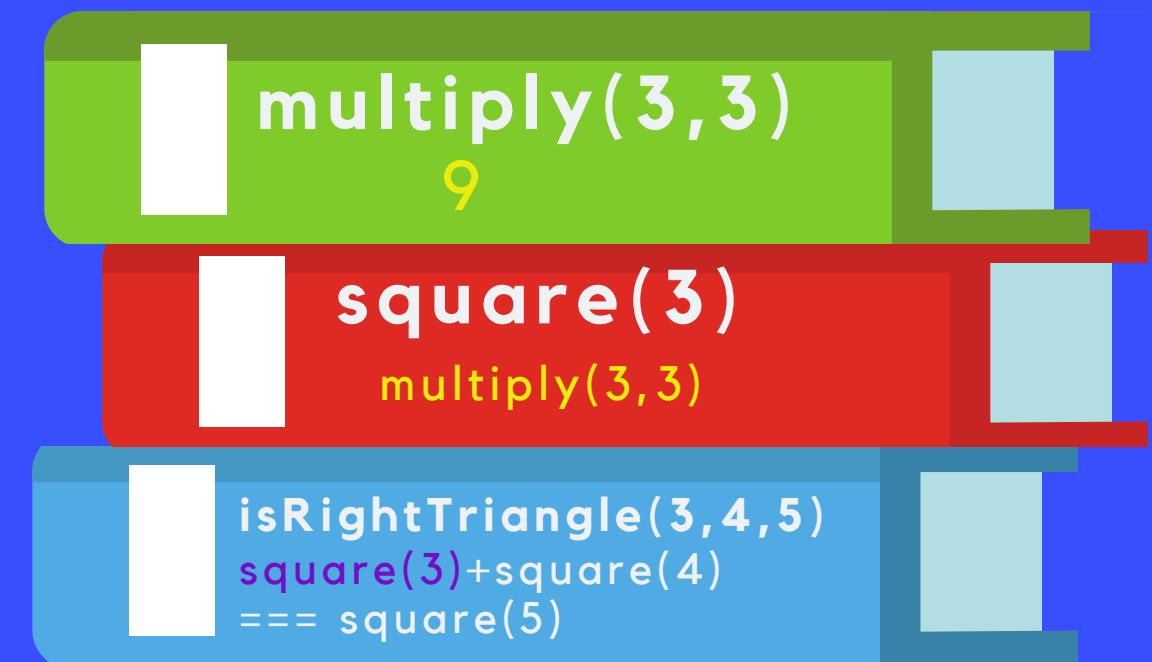

```
const multiply = (x, y) => x * y;  
→ const square = (x) => multiply(x, x);  
const isRightTriangle = (a, b, c) => {  
    return square(a) + square(b) === square(c);  
};  
isRightTriangle(3, 4, 5);
```

square(3)
multiply(3,3)

isRightTriangle(3,4,5)
square(3)+square(4)
==== square(5)

```
→const multiply = (x, y) => x * y;  
  
const square = (x) => multiply(x, x);  
  
const isRightTriangle = (a, b, c) => {  
    return square(a) + square(b) === square(c);  
};  
  
isRightTriangle(3, 4, 5);
```

```

};  
  
isRightTriangle(3, 4, 5);
```

true

JS IS
SINGLE
THREADED

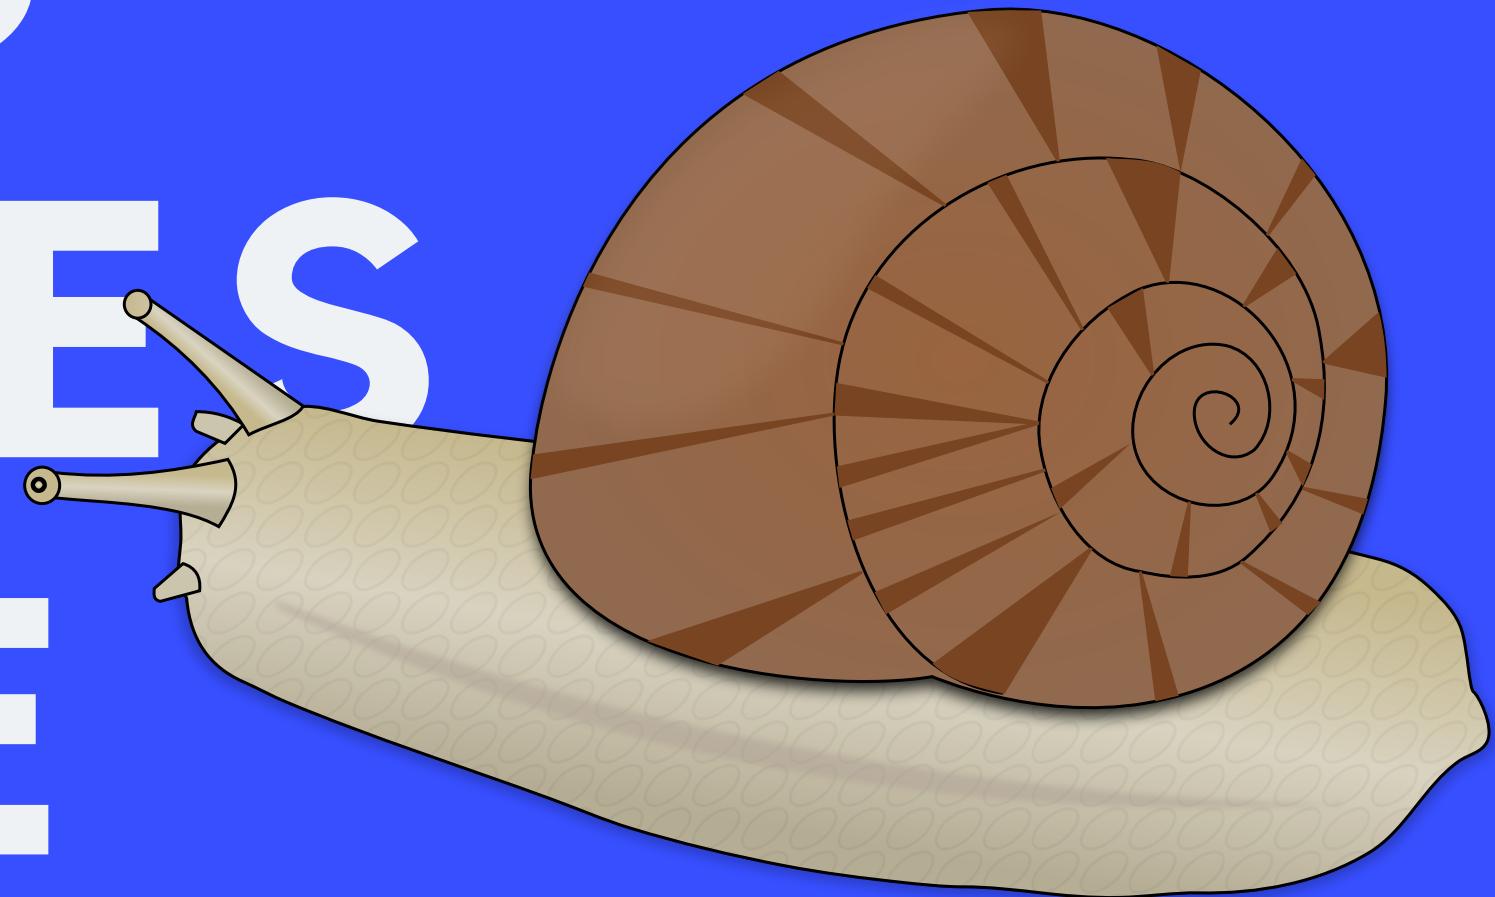

WHAT DOES THAT MEAN?

At any given point in time, that single JS thread is running at most one line of JS code.

THIS
TAKES
TIME

IS OUR APP
GOING TO
GRIND TO
A HALT?

What happens when something takes a long time?

```
const newTodo = input.value; //get user input  
saveToDatabase(newTodo); //this could take a while!  
input.value = ''; //reset form
```

Fortunately...
We have a workaround

```
console.log('I print first!');  
setTimeout(() => {  
  console.log('I print after 3 seconds');  
}, 3000);  
console.log('I print second!');
```

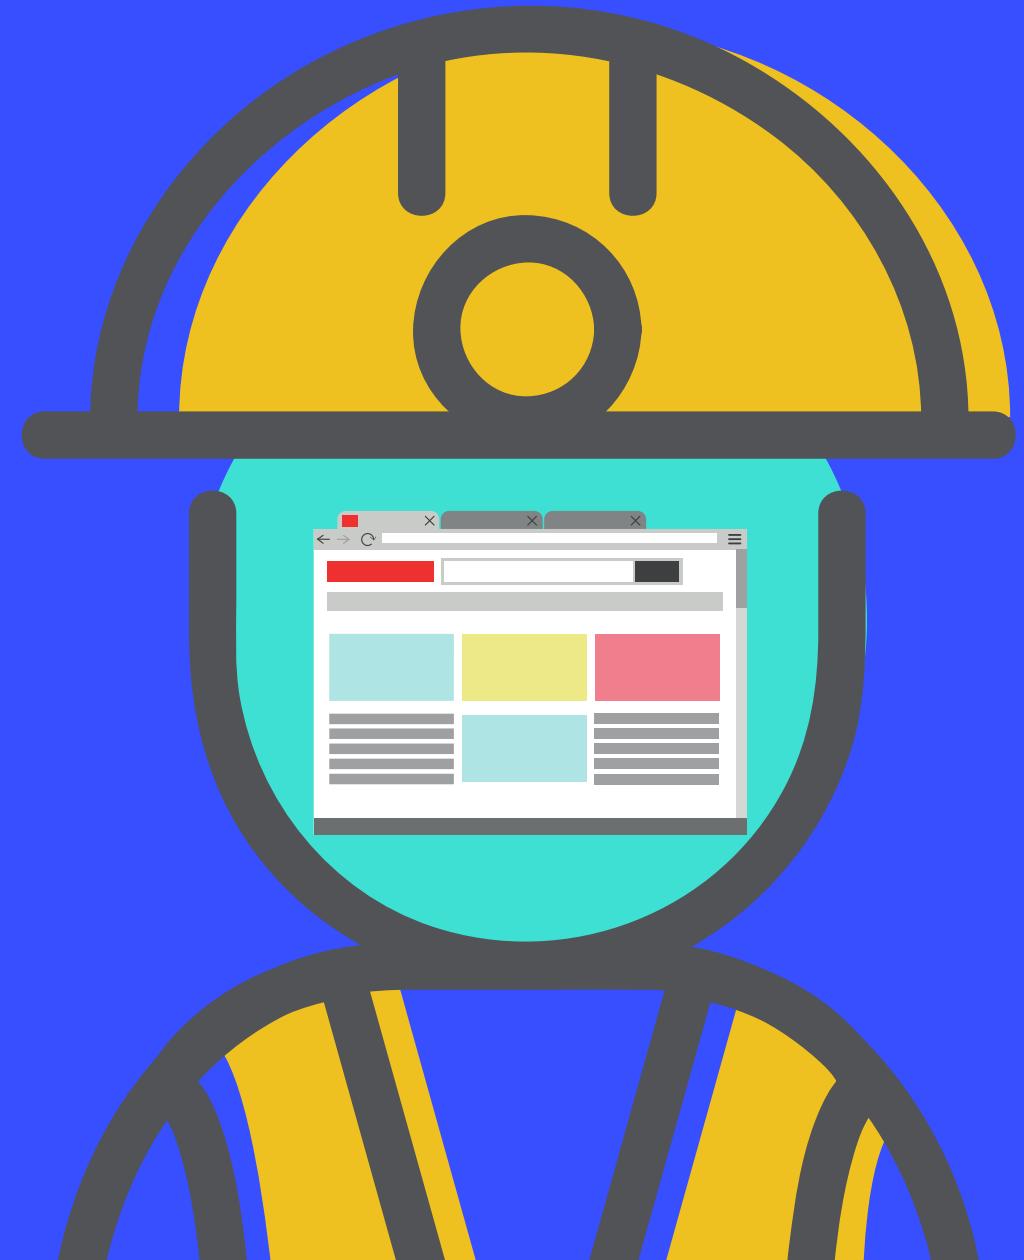

CALLBACKS????!

HOW DOES IT WORK?

THE
BROWSER
DOES THE
WORK!

TO THE
RESCUE

OK BUT HOW?

- Browsers come with Web APIs that are able to handle certain tasks in the background (like making requests or setTimeout)
- The JS call stack recognizes these Web API functions and passes them off to the browser to take care of
- Once the browser finishes those tasks, they return and are pushed onto the stack as a callback.

A CLOSER LOOK

```
console.log('I print first!');  
setTimeout( () => {  
    console.log('I print after 3 seconds');  
}, 3000);  
console.log('I print second!');
```

> I print first!

```
console.log('I print first!');  
setTimeout(() => {  
    console.log('I print after 3 seconds');  
}, 3000);  
console.log('I print second!');
```

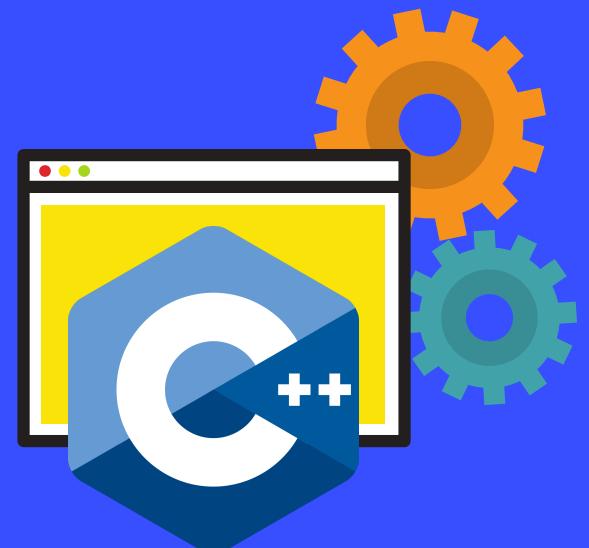

> I print first!

```
console.log('I print first!');  
setTimeout(() => {  
    console.log('I print after 3 seconds');  
}, 3000);  
console.log('I print second!');
```

Hey browser, can you
set a timer for 3
seconds?

OKEEEDOKEEE

- > I print first!
- > I print second!

```
● ● ●  
console.log('I print first!');  
setTimeout(() => {  
    console.log('I print after 3 seconds');  
}, 3000);  
console.log('I print second!');
```

- > I print first!
- > I print second!

```
● ● ●  
console.log('I print first!');  
setTimeout(() => {  
    console.log('I print after 3 seconds');  
, 3000);  
console.log('I print second!');
```

Will do!
Thanks, browser!

Time's Up!!!
Make sure you run
that callback now!!

- > I print first!
- > I print second!
- > I print after 3 seconds!

```
● ● ●  
console.log('I print first!')  
setTimeout(() => {  
    console.log('I print after 3 seconds');  
, 3000);  
console.log('I print second!');
```

Callback Hell

```
fs.readdir(source, function (err, files) {  
  if (err) {  
    console.log('Error finding files: ' + err)  
  } else {  
    files.forEach(function (filename, fileIndex) {  
      console.log(filename)  
      gm(source + filename).size(function (err, values) {  
        if (err) {  
          console.log('Error identifying file size: ' + err)  
        } else {  
          console.log(filename + ' : ' + values)  
          aspect = (values.width / values.height)  
          widths.forEach(function (width, widthIndex) {  
            height = Math.round(width / aspect)  
            console.log('resizing ' + filename + 'to ' + height + 'x' + height)  
            this.resize(width, height).write(dest + 'w' + width + '_' + filename,  
function(err) {  
  if (err) console.log('Error writing file: ' + err)  
})  
.bind(this))  
}  
})  
})  
})
```

ENTER PROMISES

A Promise is an object representing the eventual completion or failure of an asynchronous operation

PROMISES

A pattern
for writing
async code.

• •

RESOLVE

REJECT

A promise is a returned object to which you attach callbacks, instead of passing callbacks into a function

loadRedditPosts (not shown)
returns a promise

```
loadRedditPosts('/r/funny')
  //this runs if promise is resolved:
  .then((res) => {
    console.log(res.data);
  })
  //this runs if promise is rejected:
  .catch((err) => {
    console.log('Oh No!', err);
  });
}
```

This function returns a Promise which is randomly resolved/rejected.

```
const makeFakeRequest = () => {
  return new Promise((resolve, reject) => {
    setTimeout(() => {
      const randNum = Math.random();
      if (randNum > 0.5) resolve({ data: 'lol', status: 200 });
      reject({ status: 404, data: 'NO DICE' });
    }, 1000);
  });
};
```
